Sample Image Processing Exam Questions with Answers

Below are several typical exam questions, along with detailed answers to illustrate proper problem-solving approaches.

Question 1: Explain the difference between spatial domain and frequency domain processing with examples.

Answer:

Spatial domain and frequency domain are two fundamental approaches in image processing.

- **Spatial Domain:** This approach involves directly manipulating pixel values of an image. Operations are performed on the image as a whole or on specific regions. Examples include image enhancement techniques like contrast stretching, histogram equalization, and spatial filtering (e.g., using a kernel for blurring or sharpening).

- **Frequency Domain:** This method transforms the image into the frequency domain using mathematical tools like Fourier Transform. Processing in this domain involves modifying the image's frequency components. Examples include filtering high-frequency noise or smoothing by removing high-frequency components, and image compression using transforms like DCT (Discrete Cosine Transform).

Summary: Spatial domain works directly with pixel intensities, suitable for localized operations, while frequency domain manipulates the image's spectral components, often used for global filtering and compression.

Question 2: Describe the process of image histogram equalization and its purpose.

Answer:

Histogram equalization is a technique used to improve the contrast of an image by redistributing the intensity values.

Process:

- Calculate the histogram of the image, which represents the frequency of each intensity level.
- Compute the cumulative distribution function (CDF) from the histogram.
- Normalize the CDF to span the full intensity range (e.g., 0 to 255 for 8-bit images).
- Map each original pixel intensity to a new intensity based on the normalized CDF, resulting in a uniformly distributed histogram.

Purpose:

- To enhance the global contrast of an image, especially when the usable data is confined to a narrow intensity range.
- To reveal hidden details in underexposed or overexposed images.

Example: If an image's histogram is concentrated in a small range, equalization spreads out the intensity values, making features more distinguishable.

Question 3: What is the role of edge detection in image processing? Name and briefly describe two common edge detection algorithms.

Answer:

Role of Edge Detection:

Edge detection is crucial for identifying boundaries and discontinuities in intensity, which often correspond to object edges within an image. It is fundamental in image segmentation, feature extraction, and object recognition tasks.

Common Algorithms:

- **Sobel Operator:** Uses convolution with kernels to approximate the gradient of image intensity. It emphasizes edges in horizontal and vertical directions, providing a simple yet effective method for edge detection.

- **Canny Edge Detector:** A multi-stage algorithm that involves noise reduction (via Gaussian filtering), gradient calculation, non-maximum suppression, and hysteresis thresholding. It produces thin, accurate edges and is widely regarded as one of the best edge detection methods.

Question 4: Define image segmentation and discuss two methods used for segmentation.

Answer:

Image Segmentation:

It is the process of partitioning an image into meaningful regions or objects to simplify analysis and facilitate recognition.

Methods:

- **Thresholding:** Divides the image based on intensity values. Pixels above a certain threshold are classified as foreground, and those below as background. It's simple and effective for images with bimodal histograms.

- **Region Growing:** Starts with seed points and iteratively adds neighboring pixels that have similar properties (e.g., intensity) to form regions. It is useful for segmenting objects with similar characteristics.

Question 5: Explain the concept of image compression and differentiate between lossless and lossy compression with examples.

Answer:

Image Compression:

It reduces the size of an image file, enabling efficient storage and transmission without significantly compromising quality.

Lossless Compression:

- Preserves all original data; the image can be perfectly reconstructed.
- Examples: PNG, GIF, ZIP compression.

Lossy Compression:

- Removes some image data, leading to a loss of quality, but achieves higher compression ratios.
- Examples: JPEG, WebP.

Differences:

Aspect	Lossless	Lossy
Data retention	Perfect	Approximate
Compression ratio	Lower	Higher
Common use	Medical imaging, technical drawings	Photographs, web images

Image processing exams typically feature a combination of question types, including:

- Multiple Choice Questions (MCQs)
- Short Answer Questions
- Descriptive or Essay-Type Questions
- Numerical Problems / Algorithm Implementation
- Practical/Practical-based Problems (e.g., image analysis tasks)

These formats aim to evaluate both theoretical understanding and hands-on skills.

Key Topics & Concepts Typically Covered

To excel in these exams, students need a thorough understanding of core areas, such as:

- Digital Image Representation and Storage
- Image Enhancement Techniques (e.g., histogram equalization, filtering)
- Geometric Transformations (scaling, rotation, translation)

- Image Restoration and Noise Removal
- Color Image Processing
- Image Segmentation Techniques
- Morphological Image Processing
- Image Compression and Encoding
- Applications in Medical Imaging, Remote Sensing, etc.

Sample Image Processing Exam Questions with Answers

To illustrate the depth and scope of typical exam questions, here are carefully curated samples along with detailed answers.

1. Multiple Choice Question (MCQ)

Question:

Which of the following techniques is primarily used for edge detection in images?

- A) Histogram Equalization
- B) Gaussian Smoothing
- C) Sobel Operator
- D) Fourier Transform

Answer:

- C) Sobel Operator

Explanation:

Edge detection aims to identify boundaries within images by highlighting regions with high intensity changes. The Sobel operator is a discrete differentiation operator that computes an approximation of the gradient of the image intensity function, making it highly effective for detecting edges. Histogram equalization improves contrast, Gaussian smoothing reduces noise, and Fourier transform is used for frequency domain analysis, but none is primarily dedicated to edge detection.

2. Short Answer Question

Question:

Explain the process of histogram equalization and its purpose in image processing.

Answer:

Histogram equalization is a technique used to improve the contrast of an image by redistributing the intensity values to span the entire available range. The process involves:

- Computing the histogram of the input image, which shows the frequency of each intensity level.
- Calculating the cumulative distribution function (CDF) of the histogram.
- Normalizing the CDF to match the desired intensity range (e.g., 0-255 for an 8-bit image).
- Mapping each pixel intensity to a new value based on the normalized CDF.

Purpose:

The primary goal is to enhance the visibility of details in images that are overly dark or bright by spreading out the most frequent intensity values, thus increasing the overall contrast. It is especially useful in images with poor contrast due to underexposure or overexposure.

3. Descriptive / Conceptual Question

Question:

Describe the difference between image enhancement and image restoration. Provide examples of each.

Answer:

Image Enhancement focuses on improving the visual appearance of an image or making it more suitable for a specific task. It generally involves operations that emphasize certain features or improve overall quality without necessarily reversing distortions. Enhancements are often subjective and aimed at human interpretation.

Examples:

- Histogram equalization
- Contrast stretching
- Sharpening filters
- Noise reduction for aesthetic purposes

Image Restoration, on the other hand, aims to reconstruct or recover an original image that has been degraded by known distortions or noise. Restoration is an inverse problem that uses mathematical models to remove blurring, noise, or other distortions based on the degradation process.

Examples:

- Deblurring an image affected by motion blur
- Removing Gaussian noise using filtering techniques
- Restoring a scanned document affected by scanning artifacts

The key difference lies in the intent: enhancement improves appearance, often subjectively, while restoration seeks to recover the true original image based on known degradation models.

4. Numerical / Algorithm-Based Question

Question:

Given a grayscale image with pixel intensities ranging from 0 to 255, perform histogram equalization on the following small data set:

Original pixel intensities: [52, 55, 61, 59, 79, 61, 76, 61, 64, 73]

Calculate the new pixel values after histogram equalization.

Answer:

Step 1: Count the frequency of each intensity value

| Intensity | Frequency |

|-----|-----|

| 52 | 1 |

| 55 | 1 |

| 59 | 1 |

| 61 | 3 |

| 64 | 1 |

| 73 | 1 |

| 76 | 1 |

| 79 | 1 |

Total pixels = 10

Step 2: Compute the cumulative distribution function (CDF)

| Intensity | Frequency | Cumulative | CDF (normalized) |

|-----|-----|-----|-----|

| 52 | 1 | 1 | $1/10 = 0.1$ |

| 55 | 1 | 2 | $2/10 = 0.2$ |

| 59 | 1 | 3 | $3/10 = 0.3$ |

| 61 | 3 | 6 | $6/10 = 0.6$ |

| 64 | 1 | 7 | $7/10 = 0.7$ |

| 73 | 1 | 8 | $8/10 = 0.8$ |

| 76 | 1 | 9 | $9/10 = 0.9$ |

| 79 | 1 | 10 | $10/10 = 1.0$ |

Step 3: Map the CDF to new intensity levels

Using the formula:

$\lfloor$

$s = \text{round}(\text{CDF} \times (L - 1))$

$\rfloor$

where $(L=256)$:

For each intensity:

| Original | CDF | New value (s) |

|-----|-----|-----|

| 52 | 0.1 | $\text{round}(0.1 \cdot 255) = 26$ |

| 55 | 0.2 | $\text{round}(0.2 \cdot 255) = 51$ |

| 59 | 0.3 | $\text{round}(0.3 \cdot 255) = 77$ |

| 61 | 0.6 | $\text{round}(0.6 \cdot 255) = 153$ |

| 64 | 0.7 | $\text{round}(0.7 \cdot 255) = 179$ |

| 73 | 0.8 | $\text{round}(0.8 \cdot 255) = 204$ |

| 76 | 0.9 | $\text{round}(0.9 \cdot 255) = 230$ |

| 79 | 1.0 | $\text{round}(1.0 \cdot 255) = 255$ |

Step 4: Replace original pixel intensities with new values

Original pixels: [52, 55, 61, 59, 79, 61, 76, 61, 64, 73]

Corresponding new values:

- 52 $\rightarrow$ 26
- 55 $\rightarrow$ 51
- 61 $\rightarrow$ 153
- 59 $\rightarrow$ 77
- 79 $\rightarrow$ 255
- 61 $\rightarrow$ 153
- 76 $\rightarrow$ 230
- 61 $\rightarrow$ 153
- 64 $\rightarrow$ 179
- 73 $\rightarrow$ 204

Final equalized pixel set: [26, 51, 153, 77, 255, 153, 230, 153, 179, 204]
