## Getting Started with API ZYM

This section guides you through the initial steps, including authentication, making your first request, and understanding response structures.

### Authentication Process

API ZYM supports two primary authentication methods:

- **API Key Authentication:** Include your API key in the request header or as a URL parameter.
- **OAuth 2.0:** Implement OAuth flow to obtain access tokens for secure access.

Example: Using API Key in Header

```
```http
```

```
GET /v1/data HTTP/1.1
```

```
Host: api.zym.com
```

```
Authorization: Bearer YOUR_API_KEY
```

```
Content-Type: application/json
```

```
```
```

Note: Replace "YOUR\_API\_KEY" with your actual key.

## Making Your First API Call

- Choose the endpoint relevant to your data needs.
- Construct the HTTP request with proper headers and parameters.
- Send the request using your preferred tool or code.

Sample Request Using curl:

```
```bash
```

```
curl -X GET "https://api.zym.com/v1/data" \
```

```
-H "Authorization: Bearer YOUR_API_KEY" \
```

```
-H "Content-Type: application/json"
```

```
```
```

- Review the response, which should include status code, data payload, and metadata.

## Understanding API Endpoints

API ZYM offers multiple endpoints categorized based on data types or functions.

### Common Endpoints

- **/v1/data**: Retrieve data records
- **/v1/data/{id}**: Access specific data entry by ID
- **/v1/data/search**: Search data with filters
- **/v1/operations**: Perform actions or transactions

### Using Query Parameters

Endpoints often accept query parameters to refine results:

- **filter**: Apply filters based on fields (e.g., date, category)
- **limit**: Limit number of results
- **offset**: Pagination support
- **sort**: Sorting order

Example:

```
```http
```

```
GET /v1/data/search?filter=category:news&limit=10&sort=date_desc
```

```
```
```

## Handling Responses and Errors

Efficient API usage requires understanding responses and managing errors.

### Response Structure

Most responses are in JSON format with the following structure:

```
```json
```

```
{
```

```
"status": "success" or "error",
```

```
"data": {...} or [...],
```

```
"message": "Details or error message",
```

```
"metadata": {...}
```

```
}
```

```
```
```

### Error Handling

Common HTTP status codes:

- **200 OK:** Successful request
- **400 Bad Request:** Invalid request syntax or parameters
