Question What is the main function of the nervous system? The main function of the nervous system is to coordinate and control the body's activities by transmitting signals between different parts of the body. What are the two primary divisions of the nervous system? The two primary divisions are the central nervous system (brain and spinal cord) and the peripheral nervous system (nerves outside the brain and spinal cord). What role do neurons play in the nervous system? Neurons are the fundamental units of the nervous system that transmit electrical and chemical signals throughout the body. How does the nervous system respond to stimuli? The nervous system responds to stimuli by detecting changes through sensory receptors and sending signals to the brain or spinal cord, which then processes the information and initiates a response. What is the significance of the synapse in neural communication? The synapse is the gap between two neurons where chemical signals are transmitted, allowing neurons to communicate effectively. Name a common disease that affects the nervous system. Alzheimer's disease is a common neurodegenerative disorder that affects memory and cognitive functions. What is the function of the brain in the nervous system? The brain processes sensory information, controls voluntary and involuntary actions, and is the center of thoughts, emotions, and memory. How do the sympathetic and parasympathetic nervous systems differ? The sympathetic nervous system prepares the body for 'fight or flight' responses, while the parasympathetic nervous system promotes 'rest and digest' activities to conserve energy. Why is understanding the nervous system important for health? Understanding the nervous system helps in diagnosing, treating, and preventing neurological disorders, and promotes overall health by maintaining proper neural function.
