These notes serve as a comprehensive guide to key concepts, structures, and processes that are essential for students aiming to excel in biology. Covering topics such as cell biology, plant and animal systems, genetics, and ecology, this resource is tailored to enhance learning, revision, and exam preparation.

Introduction to Biology

Biology is the branch of science that studies living organisms, their structure, function, growth, evolution, and interactions with the environment. At Form 3, students are introduced to fundamental biological principles, which pave the way for more advanced topics in later studies.

Importance of Studying Biology

- Understanding the diversity of life
- Appreciating the complexity of living organisms
- Recognizing the importance of conservation and environmental management
- Preparing for careers in health, agriculture, research, and environmental sciences

Cell Structure and Function

Cells are the basic units of life. Understanding their structure and functions is crucial in biology.

Types of Cells

- **Prokaryotic cells:** Simpler cells without a nucleus, e.g., bacteria.
- **Eukaryotic cells:** More complex, with a nucleus, e.g., plant and animal cells.

Cell Components and Their Functions

- **Cell membrane:** Controls what enters and exits the cell.
- **Cytoplasm:** Jelly-like substance where organelles are suspended.

- **Nucleus:** Contains genetic material (DNA); controls cell activities.
- **Cell wall (plants only):** Provides structural support and protection.
- **Chloroplasts (plants only):** Site of photosynthesis.
- **Mitochondria:** Powerhouses of the cell, produce energy.
- **Vacuoles:** Storage of nutrients and waste products.

Differences Between Plant and Animal Cells

- Plant cells have cell walls, chloroplasts, and large central vacuoles, unlike animal cells.
- Animal cells are generally more flexible and have smaller vacuoles.

Nutrition in Organisms

Nutrition is vital for growth, repair, and maintenance of life processes.

Types of Nutrition

- **Autotrophic nutrition:** Organisms make their own food (e.g., green plants via photosynthesis).
- **Heterotrophic nutrition:** Organisms obtain food from other sources.

Photosynthesis

Photosynthesis is the process by which green plants make food using sunlight, carbon dioxide, and water, producing oxygen as a by-product.

- **Equation:** $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{light energy} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- **Location:** Chloroplasts in plant cells

Types of Heterotrophic Nutrition

- **Herbivores:** Feed on plants
- **Carnivores:** Feed on animals
- **Omnivores:** Feed on both plants and animals
- **Decomposers:** Break down dead organic matter

Respiration

Respiration is the process of releasing energy from food.

Types of Respiration

- **Aerobic respiration:** Requires oxygen; produces more energy.
- **Anaerobic respiration:** Does not require oxygen; less energy produced.

Aerobic Respiration Process

Occurs in both plants and animals, involving the breakdown of glucose to produce energy (ATP), carbon dioxide, and water.

- Glucose + Oxygen → Carbon dioxide + Water + Energy

Transport in Plants and Animals

Transport systems ensure the movement of nutrients, gases, and wastes within organisms.

Transport in Plants

- **Xylem:** Transports water and minerals from roots to leaves.
- **Phloem:** Transports food (sugar) from leaves to other parts.

Transport in Animals

- **Circulatory system:** Comprises the heart, blood vessels, and blood to circulate substances.
- **Types:** Open circulatory system (e.g., insects) and closed circulatory system (e.g., mammals).

Excretion and Osmoregulation

Organisms need to eliminate waste products and regulate water and salts.

Excretory Organs

- Kidneys (in mammals): Remove urea and excess salts.
- Lungs: Excrete carbon dioxide.

- Skin: Excretes sweat, containing salts and urea.

Osmoregulation

Maintaining water and salt balance is essential for cell function and overall health.

Reproduction in Plants and Animals

Reproduction ensures the continuity of species.

Types of Reproduction

- **Asexual reproduction:** Involves one parent; produces genetically identical offspring.
- **Sexual reproduction:** Involves two parents; produces genetically diverse offspring.

Asexual Reproduction Methods

- Vegetative propagation (e.g., runners, tubers)
- Binary fission (e.g., bacteria, amoeba)
- Budding (e.g., yeast, Hydra)

Sexual Reproduction in Plants

Involves flowers, pollination, fertilization, and seed formation.

- Pollination can be self or cross-pollination.
- Fertilization results in the formation of a seed.

Reproduction in Animals

- Most animals reproduce sexually.
- Fertilization can be internal or external.

Development and Growth

Post-reproduction, organisms grow and develop through various stages.

Stages of Development

- Embryonic development begins with fertilization.
- Formation of tissues, organs, and body systems.
- Growth involves cell division, enlargement, and differentiation.

Genetics and Variation

Genetics studies inheritance patterns, while variation explains differences among organisms.
