Amplitude modulation exam solutions

Understanding amplitude modulation (AM) is fundamental for students and professionals in the field of communication systems. As part of exam preparations, comprehensive solutions to typical AM questions are invaluable for mastering concepts, problem-solving techniques, and application skills. This article provides in-depth solutions to common amplitude modulation exam questions, helping learners grasp the underlying principles and develop confidence in their understanding.

Introduction to Amplitude Modulation

What is Amplitude Modulation?

Amplitude modulation is a technique used in electronic communication where the amplitude of a high-frequency carrier signal is varied in proportion to the instantaneous amplitude of a baseband message signal (also called the modulating signal). It enables transmission of information over long distances via radio waves, making it a cornerstone in broadcasting and communication systems.

Mathematical Representation of AM Signals

The standard expression for an amplitude-modulated wave is:

$$s(t) = [A_c + m(t)] \cos(\omega_c t)$$

Where:

- A_c is the amplitude of the carrier wave.
- $m(t)$ is the message signal.
- ω_c is the angular frequency of the carrier wave.

In a typical case with a message signal $m(t) = A_m \cos(\omega_m t)$, the AM wave becomes:

$$s(t) = A_c \cos(\omega_c t) + A_m \cos(\omega_m t) \cos(\omega_c t)$$

Applying the trigonometric identity:

$$\cos A \cos B = \frac{1}{2} [\cos(A+B) + \cos(A-B)]$$

The AM signal can be rewritten as:

$$s(t) = A_c \cos(\omega_c t) + \frac{A_m}{2} [\cos(\omega_c + \omega_m)t + \cos(\omega_c - \omega_m)t]$$

This reveals the carrier and sideband components.

Common Types of AM Exam Questions and Solutions

Question 1: Derive the expression for the amplitude-modulated wave and identify the spectrum components.

Solution:

Given:

- Carrier: $A_c \cos(\omega_c t)$
- Message: $m(t) = A_m \cos(\omega_m t)$

The modulated wave:

$$s(t) = [A_c + A_m \cos(\omega_m t)] \cos(\omega_c t)$$

Expanding:

$$s(t) = A_c \cos(\omega_c t) + A_m \cos(\omega_m t) \cos(\omega_c t)$$

Using the cosine product identity:

$$\cos(\omega_m t) \cos(\omega_c t) = \frac{1}{2} [\cos(\omega_c + \omega_m)t + \cos(\omega_c - \omega_m)t]$$

Therefore,

$$s(t) = A_c \cos(\omega_c t) + \frac{A_m}{2} [\cos(\omega_c + \omega_m)t + \cos(\omega_c - \omega_m)t]$$

Spectrum components:

- Carrier component at frequency $(f_c = \frac{\omega_c}{2\pi})$
- Upper sideband at $(f_c + f_m)$
- Lower sideband at $(f_c - f_m)$

This spectrum shows three primary components, illustrating the frequency domain structure of AM signals.

Question 2: Calculate the percentage modulation index given the carrier and message amplitudes.

Given:

- Carrier amplitude $(A_c = 10 \text{ V})$
- Message amplitude $(A_m = 4 \text{ V})$

Solution:

The modulation index (m) is defined as:

$$m = \frac{A_m}{A_c} \times 100\%$$

Substituting values:

$$m = \frac{4}{10} \times 100\% = 40\%$$

Thus, the modulation index is 40%.

Question 3: Determine the bandwidth of an AM signal with a message frequency of 3 kHz.

Solution:

The bandwidth (BW) of an AM signal is twice the maximum frequency of the message signal:

$$BW = 2 f_m$$

Given $(f_m = 3 \text{ kHz})$,

$$BW = 2 \times 3 \text{ kHz} = 6 \text{ kHz}$$

Answer: The bandwidth of the AM signal is 6 kHz.

Advanced Topics in Amplitude Modulation

Question 4: Derive the expression for total power transmitted in an AM wave.

Solution:

Total power (P_t) in an AM wave consists of:

- Power in the carrier (P_c)
- Power in the sidebands (P_{SB})

Given:

- Carrier power:

$$P_c = \frac{A_c^2}{2R}$$

- Sideband power:

$$P_{SB} = \frac{A_m^2}{4R}$$

Where (R) is the load resistance.

Since sideband power appears in both upper and lower sidebands, total sideband power is:

$$P_{\text{sidebands}} = 2 \times \frac{A_m^2}{4R} = \frac{A_m^2}{2R}$$

The total power:

$$P_t = P_c + P_{SB} = \frac{A_c^2}{2R} + \frac{A_m^2}{2R} = \frac{1}{2R} (A_c^2 + A_m^2)$$

Expressed in terms of modulation index $(m = \frac{A_m}{A_c})$:

$$P_t = \frac{A_c^2}{2R} (1 + m^2)$$

- Message Signal: The information-bearing signal, often of lower frequency, denoted as $m(t)$.
- Modulated Signal: The resulting amplitude-varying wave, expressed as $s(t) = [1 + k_a m(t)] c(t)$, where k_a is the amplitude sensitivity.

The fundamental goal of amplitude modulation is to encode information efficiently, ensuring fidelity and minimizing interference.

Case Studies: Analyzing Exemplary and Flawed Exam Solutions

To elucidate best practices and common errors, this section presents detailed case studies.

Case Study 1: Correct Derivation of Bandwidth Using Carson's Rule

Scenario: Given a message signal with a maximum frequency $(f_m = 3\text{ kHz})$ and a modulation index $(m = 0.5)$, determine the bandwidth.

Solution Highlights:

- Applying Carson's Rule: $(BW = 2(f_m + f_{\Delta}))$
- Since $(f_{\Delta} = m f_m = 0.5 \times 3\text{ kHz} = 1.5\text{ kHz})$,
- Therefore, $(BW = 2(3\text{ kHz} + 1.5\text{ kHz}) = 9\text{ kHz})$.

Analysis: The solution demonstrates a clear understanding of bandwidth calculation, with proper substitution and logical steps.

Case Study 2: Flawed Power Calculation Due to Misapplication of Power Distribution

Scenario: Calculating the total power of an amplitude-modulated wave with carrier power $(P_c = 100\text{ W})$ and modulation index $(m=0.8)$.

Incorrect Approach: Assuming total power is simply $(P_{\text{total}} = P_c (1 + m^2/2))$, instead of the correct $(P_{\text{total}} = P_c (1 + m^2/2))$.

Impact: The error leads to underestimating or overestimating the available power, affecting system efficiency analysis.

Lesson: Highlighting the importance of proper formulas and understanding the physical significance of each term.

QuestionAnswer What are the key steps involved in solving amplitude modulation (AM) exam problems? The key steps include understanding the given parameters, calculating the modulating and carrier signals, applying modulation index formulas, and using the relevant equations to find the desired quantities such as bandwidth, modulation index, or power distribution. How do you determine the bandwidth of an amplitude modulated signal in exam solutions? The bandwidth of an AM signal is determined using Carson's Rule, which states that $\text{bandwidth} = 2 \times (\text{modulation frequency} + \text{frequency deviation})$. For standard AM, it is often calculated as twice the maximum frequency of the modulating signal. What is the typical approach to calculating the power of the transmitted AM signal in exam solutions? The transmitted power in AM is calculated by summing the power in the carrier and the sidebands. The carrier power is $P_c = (A_c^2) / (2R)$, and the sideband power is related to the modulation index. The total power is then $P_{\text{total}} = P_c (1 + (m^2)/2)$, where m is the modulation index. How do exam solutions handle cases of over-modulation in amplitude modulation questions? Exam solutions emphasize that over-modulation ($m > 1$) causes distortion and distortion-related issues. They show that the modulation index should be less than or equal to 1 for proper modulation, and calculations are adjusted accordingly, often highlighting the need to limit modulation to prevent signal distortion. What are common mistakes to avoid when solving amplitude modulation problems in exams? Common mistakes include using incorrect formulas for bandwidth or power, confusing peak and RMS values, neglecting the impact of over-modulation, and misapplying the modulation index. It's important to carefully read the problem, verify units, and double-check calculations to ensure accuracy.
