- **Bone Density Loss:** Microgravity accelerates bone resorption, increasing the risk of osteoporosis and fractures upon return to Earth.
- **Fluid Redistribution:** Fluids shift towards the head, causing facial edema and intracranial pressure changes that can affect vision and neurological function.
- **Cardiovascular Deconditioning:** The heart and blood vessels adapt to microgravity, resulting in orthostatic intolerance and decreased cardiovascular fitness after spaceflight.
- **Altered Immune Function:** Spaceflight can suppress immune responses, making astronauts more susceptible to infections.
- **Neurovestibular Changes:** Balance and spatial orientation are affected due to changes in the inner ear and sensory integration.

Psychological and Behavioral Aspects

Beyond physiological changes, space missions impose psychological stressors:

- Isolation and confinement
- Disruption of circadian rhythms
