Question What are the main differences between viruses and prokaryotes? Viruses are acellular entities that require a host to replicate, whereas prokaryotes are single-celled organisms with a cellular structure, including a cell wall and genetic material. Viruses lack cellular components, while prokaryotes are cellular and capable of independent life. How do viruses infect prokaryotic cells? Viruses infect prokaryotic cells by attaching to specific receptors on the cell surface, injecting their genetic material, and hijacking the cell's machinery to produce new virus particles. What role do prokaryotes play in the environment? Prokaryotes are essential for nutrient cycling, such as nitrogen fixation and decomposition, and they help maintain ecological balance by supporting various biochemical processes. What is the significance of lysogenic and lytic cycles in viruses?
