- To foster teamwork, creativity, and project management abilities.

Project Scope and Expectations

Students are typically tasked with designing a model roller coaster that meets specific criteria, such as:

- Starting from a certain height (the initial drop).
- Incorporating various elements like loops, hills, and turns.
- Ensuring safety parameters are maintained.
- Creating a detailed plan with equations, graphs, and explanations.

The final deliverable usually includes:

- Visual diagrams or sketches of the ride layout.
- A presentation explaining the mathematical reasoning behind the design.

Applying Algebraic Concepts to Roller Coaster Design

The core of the project involves translating physical features of a roller coaster into algebraic models.

Modeling the Drop and Hills with Quadratic Functions

- Quadratic equations are ideal for modeling the vertical profiles of hills and drops because they produce parabolic shapes.
- A typical quadratic function: $y = ax^2 + bx + c$.
- The coefficient 'a' determines the steepness of the curve.
- For example, if the initial height is 100 meters and the coaster drops to 0 meters at the end, students might model the descent with a parabola opening downward.

Sample quadratic model:

Suppose the descent starts at point (0, 100) and reaches ground level at (50, 0).

Using the point-slope form:

- $y - 100 = m(x - 0)$, but since it's a parabola, more appropriately, fit the quadratic:

$$y = -k(x - h)^2 + y?$$

where h is the x-coordinate of the vertex (lowest point), y? the maximum height, and k a constant related to the curvature.

By selecting appropriate parameters, students can graph the descent and adjust for safety and thrill.

Designing Loops and Turns with Exponential and Linear Functions

- Loops can be modeled using sinusoidal functions or circles, but for simplicity, linear or exponential functions can approximate certain features.

- Turns often involve constant speed, modeled with linear equations, or acceleration, which may involve exponential decay or growth functions.

Ensuring Safety Through Mathematical Constraints

- Calculating g-forces experienced during turns and drops to ensure rider safety.
- Using inequalities to set bounds on the maximum slope or acceleration.
- For example, ensuring the slope of the descent does not exceed a certain value to prevent excessive G-forces.

Planning the Roller Coaster Layout

Once the algebraic models are established, students translate these into a physical layout.

Creating the Graphs and Equations

- Plot the height versus horizontal distance to visualize the ride.
- Use graphing calculators or software (like Desmos or GeoGebra) to refine the models.
- Adjust parameters to optimize thrill and safety.

Designing the Track Sections

- Divide the roller coaster into segments: initial drop, hills, loops, turns, and brakes.
- Assign algebraic equations to each segment.
- Connect the segments smoothly, ensuring continuity in height and slope.

Example:

- Starting segment: $y = -0.04x^2 + 4x + 100$ (parabolic descent).
- Loop segment: modeled with a circle equation $y = -(r^2 - (x - h)^2) + k$.
- Transition segments: linear functions connecting different curves.

Evaluating and Refining the Design

Once the initial design is complete, students analyze and refine their models.

Analyzing the Mathematical Models

- Verify that the equations produce realistic and safe ride profiles.
- Check for continuity and smooth transitions between segments.
- Calculate key features such as maximum height, length, and speed.

Assessing Safety and Thrill Factors

- Use physics principles combined with algebraic models to compute G-forces, speeds, and accelerations.
- Adjust equations to reduce excessive forces or to increase excitement.

Iterative Design Process

- Modify equations based on analysis results.
- Re-graph and reassess until the desired balance of safety and thrill is achieved.
- Document all changes and rationale in the project report.

Presenting and Documenting the Project

Effective communication is vital to showcase the mathematical modeling process.
