This comprehensive guide aims to provide detailed explanations, step-by-step solutions, and practical tips for solving simple curve surveying sample problems, ensuring you build a solid foundation in curve surveying principles.

Understanding Simple Curves in Surveying

Simple curves are circular curves used to connect straight lines (tangents) in surveying and civil engineering projects. They are fundamental in designing smooth transitions in roads, railways, and pathways, ensuring safety and aesthetic appeal.

Key Components of a Simple Curve

- Radius (R): The distance from the center of the curve to any point on the curve.
- Degree of Curve (D): An angular measure indicating the sharpness of the curve, often expressed in degrees per 100 feet or per 30 meters.
- Central Angle (?): The angle subtended at the center of the curve by two points on the curve.
- Length of the Curve (L): The actual length along the curve from the beginning to the end.
- Tangent (T): The straight line from the point of intersection to the point where the curve begins or ends.
- Chord (C): The straight line connecting the start and end points of the curve.
- Degree of Curvature: A measure of the sharpness of the curve, usually expressed as the central angle subtended by a 100-foot (or 30-meter) arc.

Basic Concepts and Formulas in Simple Curve Surveying

To solve simple curve problems, familiarity with standard formulas is crucial.

Key Formulas

- Length of the Curve (L):

\[

$$L = R \times \Delta \quad (\text{in radians})$$

\]

When Δ is in degrees:

\[

$$L = \frac{\pi R \Delta}{180}$$

\]

- Tangent Length (T):

\[

$$T = R \tan \left(\frac{\Delta}{2} \right)$$

\]

- Chord Length (C):

\[

$$C = 2 R \sin \left(\frac{\Delta}{2} \right)$$

\]

- Degree of Curve (D):

\[

$$D = \frac{180 \times 100}{\pi R}$$

\]

(Expressed in degrees per 100 units)

These formulas form the basis for calculating the various parameters involved in simple curve problems.

Sample Problem 1: Calculating the Length of a Simple Curve

Problem Statement:

A road engineer is designing a simple curve with a radius of 300 meters, and the central angle between the tangents is 60° . Determine the length of the curve.

Solution Steps:

- Identify known values:
 - Radius, $(R = 300\text{ m})$
 - Central angle, $(\Delta = 60^\circ)$
- Convert the central angle to radians (if necessary):

For direct formula use, degrees are acceptable.

- Calculate the length of the curve (L):

$$L = R \times \frac{\pi \Delta}{180} = 300 \times \frac{\pi \times 60}{180}$$

\]

\]

$$L = 300 \times \frac{\pi}{3} \approx 300 \times 1.0472 \approx 314.16\text{ m}$$

\]

Answer:

The length of the curve is approximately 314.16 meters.

Sample Problem 2: Finding the Tangent Length and Chord

Problem Statement:

Given a simple curve with a radius of 250 meters and a central angle of 45° , find the tangent length and the chord length.

Solution Steps:

- Identify known values:

- $(R = 250\text{ m})$

- $(\Delta = 45^\circ)$

- Calculate the tangent length (T):

\[

$$T = R \tan \left(\frac{\Delta}{2} \right) = 250 \tan(22.5^\circ)$$

\]

\[

$$T \approx 250 \times 0.4142 \approx 103.55\text{ m}$$

\]

- Calculate the chord length (C):

\[

$$C = 2 R \sin \left(\frac{\Delta}{2} \right) = 2 \times 250 \times \sin(22.5^\circ)$$

]

[

$$C \approx 500 \times 0.3827 \approx 191.35, \text{ m}$$

]

Answer:

- Tangent length ($T \approx 103.55, \text{ m}$)
- Chord length ($C \approx 191.35, \text{ m}$)

Sample Problem 3: Calculating the Degree of Curve

Problem Statement:

A curve has a length of 200 meters and subtends a central angle of 40° . Find the degree of the curve.

Solution Steps:

- Identify known values:
- ($L = 200, \text{ m}$)
- ($\Delta = 40^\circ$)
- Calculate the radius (R):

[

$$R = \frac{L}{\Delta \text{ in radians}} = \frac{200}{\frac{\pi \times 40}{180}} = \frac{200}{\frac{2\pi}{9}} \approx \frac{200 \times 9}{2\pi} \approx \frac{1800}{6.2832} \approx 286.48, \text{ m}$$

]

- Calculate the degree of curve (D):

\[

$$D = \frac{180 \times 100}{\pi R} = \frac{18000}{\pi \times 286.48} \approx \frac{18000}{899.55} \approx 20.00^\circ$$

\]

Answer:

The degree of the curve is approximately 20°.

Simple Curve Surveying Sample Problems: A Comprehensive Guide

Understanding the fundamentals of simple curve surveying is essential for civil engineers, surveyors, and students aiming to master the art of alignment and curve calculations in highway, railway, and other infrastructure projects. Mastery over sample problems not only enhances conceptual clarity but also boosts confidence in tackling real-world surveying challenges. This guide delves deeply into the formulation, solving techniques, and illustrative sample problems related to simple curves in surveying.

Introduction to Simple Curves in Surveying

A simple curve is a basic type of curve used in alignment design, characterized by a single arc connecting two straight lines (tangents). It is primarily classified as either concave or convex and is employed to facilitate smooth transitions between straight sections of a road or railway.

Key parameters in simple curve surveying include:

- Radius (R): The radius of the curve, which determines its sharpness.
- Length of the Curve (L): The length of the arc from the point of intersection (P.I.) to the point of tangent (P.T.) or point of curve (P.C.).
- Degree of the Curve (D): The angle subtended by a 100 ft (or 30 meters) arc, used in highway curves.
- Chord length (C): The straight line connecting the two ends of the curve.
- Tangents (T): The straight lines from the P.C. and P.T. to the P.I.
- Offsets: Distances measured perpendicular to the tangent or chord to locate points along the curve.

Basic Concepts and Terminology in Simple Curve Surveying

Understanding the following terms is crucial:

- Point of Intersection (P.I.): The point where the tangents meet, and the curve begins.
- Point of Curve (P.C.): The point where the curve starts.
- Point of Tangency (P.T.): The point where the curve ends.
- Center of the Curve (C): The midpoint of the curve arc, lying at a perpendicular distance R from the P.I.
- Long Chord: The straight line connecting P.C. and P.T.
- Mid-ordinate: The maximum offset of the curve measured from the chord or tangent at the midpoint of the curve.

Types of Simple Curves and Their Equations

The most common simple curves in surveying are circular curves with a constant radius.

Key equations:

- Arc Length (L):

$$L = R \times \theta$$

where θ is in radians.

- Degree of Curve (D):

$$D = \frac{180 \times 100}{\pi \times R} \quad (\text{for a 100 ft arc in imperial units}).$$

- Chord Length (C):

$$C = 2 R \sin\left(\frac{\theta}{2}\right)$$

- Tangential Offset (T):

$$T = R (1 - \cos\left(\frac{\theta}{2}\right))$$

- Mid-ordinate (M):

$$M = R (1 - \cos\left(\frac{\theta}{2}\right))$$

- Distance from P.C. to P.I. (Long Chord):

$$C = 2 R \sin\left(\frac{\theta}{2}\right)$$

Sample Problems in Simple Curve Surveying

Applying these concepts to sample problems enhances understanding. Below are detailed solutions to typical problems encountered in simple curve surveying.

Problem 1: Calculating Radius from Given Data

Given:

- Length of the curve, $(L = 300\text{ m})$
- Degree of the curve, $(D = 3^\circ)$

Find:

- Radius (R)

Solution:

- Convert Degree to Radians:

$$\theta = \frac{L}{R}$$

But because degree of curve (D) relates to the angle subtended by a 100 ft arc:

$$D = \frac{180 \times 100}{\pi R}$$

- Calculate R:

$$R = \frac{180 \times 100}{\pi D} = \frac{18000}{\pi \times 3} \approx \frac{18000}{9.4248} \approx 1910.83\text{ ft}$$

Convert to meters:

\[

$$R \approx 1910.83 \times 0.3048 \approx 582.83, \text{ m}$$

\]

Answer:

- The radius of the curve is approximately 583 meters.

Problem 2: Determining the Length of a Simple Curve

Given:

- Radius $(R = 200, \text{ m})$
- Degree of curve $(D = 3^\circ)$

Find:

- Length of the curve (L)

Solution:

- Calculate the central angle (θ) :

\[

$$D = \frac{180 \times 100}{\pi R} \Rightarrow \theta = \frac{L}{R}$$

\]

But in practice, for a degree D curve:

\[

$$\theta = \frac{D \times L}{180}$$

]

- Alternatively, use the relation:

[

$$L = R \times \theta$$

]

where θ (in radians):

[

$$\theta = \frac{\pi D}{180}$$

]

For $(D=3^{\circ})$:

[

$$\theta = \frac{\pi \times 3}{180} = \frac{\pi}{60} \approx 0.05236, \text{ radians}$$

]

- Calculate L:

[

$$L = R \times \theta = 200 \times 0.05236 \approx 10.472, \text{ m}$$

]

Answer:

- The length of the curve is approximately 10.47 meters.

Problem 3: Locating the P.C. and P.T. Given the P.I. and Curve Parameters

Given:

- Point of Intersection (P.I.) at coordinates (1000 m, 2000 m)
- Radius $(R = 150\text{ m})$
- Degree of curve $(D = 4^\circ)$
- Tangent bearing at P.I. is N45°E

Find:

- Coordinates of the P.C. and P.T.

Solution:

- Calculate the length of the curve (L) :

[

$$\theta = \frac{\pi D}{180} = \frac{\pi \times 4}{180} = \frac{\pi}{45} \approx 0.06981, \text{ radians}$$

]

[

$$L = R \times \theta = 150 \times 0.06981 \approx 10.47, \text{ m}$$

]

- Determine the tangent length (T) :

[

$$T = R \tan\left\{\frac{\theta}{2}\right\} = 150 \times \tan\{(0.0349)\} \approx 150 \times 0.0349 \approx 5.24, \text{ m}$$

\]

- Locate P.C.:

- Since the tangent bearing is N45°E, the P.C. is located along this bearing from P.I. by a distance (T) .

- Coordinates:

\[

\begin{cases}

$$x_{\text{P.C.}} = x_{\text{P.I.}} + T \times \sin\{45^\circ\}$$

$$y_{\text{P.C.}} = y_{\text{P.I.}} + T \times \cos\{45^\circ\}$$

\end{cases}

\]

- Compute:

\[

$$x_{\text{P.C.}} = 1000 + 5.24 \times 0.7071 \approx 1000 + 3.71 = 1003.71, \text{ m}$$

\]

\[

$$y_{\text{P.C.}} = 2000 + 5.24 \times 0.7071 \approx 2000 + 3.71 = 2003.71, \text{ m}$$

\]

- Locate P.T.:

- The P.T. is located along the same bearing from P.I., but at a distance $(L - T)$:

[

$$\text{Distance from P.I. to P.T.} = 10.47 - 5.24 = 5.24 \text{ m}$$

]

- Coordinates:

[

$$x_{\text{P.T.}} = 1000 + 5.24 \times 0.7071 \approx 1003.71 \text{ m}$$

]

[

$$y_{\text{P.T.}} =$$

Question What is the primary objective of simple curve surveying? The main objective of simple curve surveying is to accurately determine the location and length of a curve connecting two straight line segments, ensuring smooth transitions in alignment for roads, railways, or pipelines. How do you calculate the length of a simple curve in surveying? The length of a simple curve (L) is calculated using the formula $L = R \theta$, where R is the radius of the curve and θ is the central angle in radians or degrees between the tangent points. What is the process of setting out a simple curve in the field? To set out a simple curve, surveyors first measure and mark the tangent points from a baseline, then calculate the curve parameters (radius, length, and central angle), and finally use offset distances and the chord to accurately locate the curve points in the field. How do you compute the tangent length for a simple curve? The tangent length (T) is computed using the formula $T = R \tan(\theta/2)$, where R is the radius and θ is the central angle in degrees. What are common sample problems encountered in simple curve surveying? Common problems include calculating the curve length, tangent length, external distance, and setting out points accurately based on given parameters like radius and central angle. How can errors be minimized when solving simple curve survey problems? Errors can be minimized by precise measurement, double-checking calculations, using accurate instruments for fieldwork, and applying proper surveying techniques for setting out curves. What is the significance of the external distance in simple curve surveying? The external distance (E) is the perpendicular distance from the midpoint of the curve to the chord and is important for accurate curve setting and for verifying the correctness of the curve layout. Can you provide a sample problem involving calculating the length of a curve with a given radius and central

angle? Certainly. For example, if a curve has a radius of 300 meters and a central angle of 60° , the length of the curve is $L = R \theta$ (in radians). First, convert 60° to radians ($\pi/3$). Then, $L = 300 (\pi/3) = 300 \times 1.0472 = 314.16$ meters.
