- Inner membrane has folds called cristae ? increasing surface area (1 mark)
- Matrix contains enzymes involved in the Krebs cycle (1 mark)
- Membrane proteins involved in the electron transport chain (1 mark)
- Structure supports efficient ATP production (1 mark)

Model answer based on the markscheme:

The mitochondrion has a double membrane, which separates the internal environment and creates compartments. The inner membrane is folded into cristae, increasing surface area for enzyme attachment, which enhances ATP production. The matrix contains enzymes for the Krebs cycle, essential for energy release. The presence of membrane proteins in the inner membrane facilitates the electron transport chain, vital for oxidative phosphorylation. Overall, the structure of the mitochondrion supports its role in efficient energy production.
