Core Concepts in Cognitive Neuroscience

Neural Substrates of Cognition

Key brain regions implicated in cognitive functions include:

- Prefrontal Cortex (PFC): Central to executive functions such as planning, decision-making, and working memory.
- Hippocampus: Essential for the formation and retrieval of declarative memories.
- Temporal Lobes: Involved in auditory processing and language comprehension.

- Salience Network: Detects and filters salient stimuli, mediating switching between DMN and CEN.

These networks are interconnected via white matter tracts, facilitating rapid communication essential for complex cognition.

Neuroplasticity and Cognitive Adaptability

Neuroplasticity refers to the brain's ability to reorganize and form new connections in response to experience, learning, or injury. This adaptability underpins cognitive development and recovery,

making it a central theme in cognitive neuroscience research and clinical applications.
