The Gait Cycle: A Perry Perspective

Understanding the gait cycle is fundamental to Perry's gait analysis approach. The cycle comprises two main phases:

Stance Phase (60% of the gait cycle)

- Begins with heel strike (initial contact).
- Includes midstance and toe-off.
- The foot bears weight, providing stability.

Swing Phase (40% of the gait cycle)

- Starts after toe-off.
- Involves limb advancement.
- Prepares the limb for the next heel strike.

Key Events in the Gait Cycle

- Heel Strike (Initial Contact): Contact of the heel with the ground.
- Loading Response: Weight acceptance.
- Midstance: Body weight shifts over the stance limb.
- Terminal Stance: Heel rise and forward progression.
- Pre-swing (Toe-off): Limb prepares to swing.
- Initial Swing: Limb lifts off.
- Mid-swing: Limb advances.
- Terminal Swing: Limb prepares for heel strike.

By analyzing each phase, Perry's method helps identify where deviations occur.

Common Gait Deviations and Their Clinical Significance

Overpronation

- The foot rolls inward excessively during stance.
- Leads to medial ankle, shin, and knee pain.
- Corrected with orthotics, strength exercises, or gait retraining.

Supination (Underpronation)

- The foot rolls outward.
- Associated with lateral ankle sprains and stress fractures.
- Managed through footwear modifications and targeted therapy.

Antalgic Gait

- Reduced stance time on the affected limb due to pain.
- Common in injury or arthritis.
- Treatment focuses on pain relief and biomechanical correction.

Trendelenburg Gait

- Pelvic drop on the contralateral side during stance.
- Indicates weak hip abductors.
- Addressed with strengthening exercises.

Limb Length Discrepancy

- Causes asymmetrical gait patterns.
- Can be addressed with orthotics or surgical intervention.
